

1-meter repositioning elbow for cable trays

Overview

Choose from our selection of cable trays, including over 850 products in a wide range of styles and sizes. Same and Next Day Delivery.

Key Takeaways

A 1-meter repositioning elbow is a cable tray fitting designed to change the direction or offset of a cable tray run while maintaining proper support and alignment for cables.

Overview
A repositioning elbow is used in cable tray systems to navigate corners, offsets, or changes in elevation without compromising cable integrity. The 1-meter specification typically refers to the length of the offset or the horizontal/vertical span the elbow covers, allowing for smooth transitions in cable routing .

Materials and Construction

These elbows are commonly manufactured from:

- Galvanized steel – for corrosion resistance and mechanical strength
- Stainless steel – for high durability in harsh environments
- Aluminum alloy – lightweight and corrosion-resistant, suitable for indoor and outdoor use

- Fiberglass-reinforced plastic (FRP) – for chemical resistance and non-conductive applications The choice of material depends on environmental conditions, load requirements, and compatibility with the existing cable tray system .

Compatibility and Types

1-meter repositioning elbows are available for various cable tray types, including:

- Ladder trays – ideal for heavy power cables
- Ventilated trays – for heat dissipation and airflow
- Solid-bottom trays – for protection against dust or electromagnetic interference They can be horizontal or vertical, inside or outside elbows, depending on the routing requirements .

Installation Considerations

- Ensure the minimum bend radius of cables is maintained to prevent damage .
- Use appropriate fasteners and connectors to secure the elbow to the main tray sections.
- Verify load capacity and support spacing to accommodate the weight of cables through the elbow .
- Consider custom fabrication if standard elbows do not meet the 1-meter offset requirement .

Suppliers and Custom Options

Leading suppliers like JLH Electric provide a wide range of cable tray fittings, including elbows, bends, tees, and custom repositioning solutions. They offer custom design and fabrication to meet specific project requirements, ensuring compatibility with different tray widths and materials . In summary, a 1-meter repositioning elbow is a versatile cable tray fitting that allows for smooth directional changes or offsets in cable routing, available in multiple materials and compatible with various tray types, with options for standard or custom fabrication to suit project needs .
