

Bare Fiber Optic Cables and Patch Cords

Overview

Fiber Optic Cable vs Patch Cord vs Pigtail – Complete Guide Understand the differences between fiber optic cables, patch cords, and pigtails. Learn standard.

Key Takeaways

Bare fiber is the unprotected optical medium used mainly in labs, while patch cords are short, flexible, connectorized cables for connecting devices in networks. Bare Fiber Optic Cables

Bare fiber refers to the raw optical fiber itself, consisting of a core, cladding, and coating, but without any protective jacket or armor . It is extremely thin, lightweight, and fragile, making it unsuitable for direct field deployment. Bare fibers are available in:

- Single-mode (SMF): ITU-T G.652 classic or G.657 bend-insensitive, ideal for long-distance or tight-space applications like FTTH .
- Multimode (MMF): OM3, OM4, OM5, suitable for short-reach, high-throughput data center links . Applications: Bare fiber is primarily used in laboratory settings, R&D, equipment calibration, and training . It is not recommended for ducts, aerial spans, direct burial, or undersea installations due to vulnerability to mechanical shocks, micro-bending, moisture, and rodents .

Fiber Optic Patch Cords

A fiber optic patch cord (also called a fiber jumper) is a short, flexible cable with connectors on both ends, designed to connect devices such as transceivers, switches, patch panels, and servers . Patch cords are factory-terminated and often include Kevlar or aramid yarn for strength under real-world handling . Types and Standards:

- Single-mode (SM, OS1/OS2): For long-distance or FTTH applications, including bend-insensitive fibers (G.657A1/A2), .
 - Multimode (MM, OM1/OM2/OM3/OM4/OM5): For short-distance, high-speed intra-data center links .
 - Connectors: LC, SC, ST, MPO/MTP, depending on equipment and density requirements . Applications: Patch cords are used for flexible, short-distance connections within networks, ensuring reliable signal transmission and easy reconfiguration . They differ from pigtails, which have a connector on only one end and are spliced to a main cable for permanent installations .
- Key Differences
- | Feature | Bare Fiber | Patch Cord |
|-------------|------------------------|--|
| Protection | None; fragile | Jacketed with Kevlar/aramid for durability |
| Connectors | None | Connectors on both ends |
| Use Case | Labs, R&D, calibration | Network connections, data centers, telecom |
| Flexibility | Very delicate | Flexible, handles real-world handling |
| Deployment | Not suitable for field | Ready for field and indoor/outdoor use |

Summary: Bare fiber is the ingredient—the raw optical medium—while patch cords are the ready-to-use solution for connecting devices in networks. Bare fiber requires protection and careful handling, whereas patch cords provide durability, connectors, and ease of deployment for practical applications .
