A dual WAN router can be configured to use both WAN connections.

A dual WAN router accepts two internet inputs—for example, fiber + cellular. These routers can be configured for load balancing, bonding, or a mix of both depending on the hardware and. That's where dual WAN (two internet connections) or triple WAN (three internet connections) routers come in. These routers allow you to connect multiple internet sources—like cable (Comcast, Cox), fiber, cellular (Verizon, T-Mobile, AT&T), or low earth orbit (LEO) satellite services like. A fiber-optic connection is the best choice for fast home internet as it has a number of advantages compared to traditional copper cables, such as faster speeds and less interference. Many major ISPs, such as Verizon and Xfinity, offer fiber connections directly to your door, known as FttP or Fiber. A dual fiber optical transceiver uses two separate fibers—one for transmitting and the other for receiving data. This design ensures higher transmission stability and supports single-wavelength bidirectional communication. Dual fiber transceivers typically feature a duplex LC interface, making them. However, you need a router capable of supporting multi-gig speeds to get fiber internet connectivity. Fiber optic connections rely on a specific type of technology that transmits data via light signals through fiber optic cables.
