

Installation of Explosion-proof Cable Trays in Bolivia

Overview

The Cable Tray Institute is now making available our complete library of technical articles which have appeared in the Cablegram.

Key Takeaways

Explosion-proof cable trays in hazardous areas must comply with zone classification, use certified materials, and follow strict installation practices to prevent ignition of flammable atmospheres. Zone Classification and Risk Assessment

Before installation, the area must be classified according to the likelihood of explosive atmospheres. For gases and vapors, zones are typically defined as:

- Zone 0: Continuous presence of explosive atmosphere – cable trays are generally not permitted.
- Zone 1: Likely presence during normal operation – requires explosion-proof trays and spark containment.
- Zone 2: Unlikely presence, only occasional – materials must resist corrosion and static buildup. For combustible dust, similar classifications exist as Zones 20, 21, and 22, with Zone 20 being the most hazardous.

Material Selection

The choice of cable tray material is critical for safety and durability:

- Aluminum Alloy: Lightweight, corrosion-resistant, requires anodized finish to prevent static buildup; electrical resistance
