

PoE switch connected to AP

Overview

Key Takeaways

A PoE switch can power and connect a wireless AP using a single Ethernet cable, transmitting both data and power while simplifying deployment and management. Direct Connection Method

The simplest way to connect a PoE switch to an AP is to use a single Ethernet cable from a PoE-enabled port on the switch directly to the AP's network port. This cable carries both data and power, eliminating the need for separate power adapters or outlets. Ensure the cable is of good quality (Cat5e or higher) to prevent power delivery issues or AP restarts .

PoE Standards and Power Requirements

PoE switches follow IEEE standards:

- 802.3af: Provides up to 15.4W per port, suitable for most standard APs.
- 802.3at (PoE+): Provides up to 30W per port, required for high-power APs or multiple radios.
- Some switches may support higher wattage (15-60W) for advanced APs . Always verify the AP's power requirements before connecting.

Deployment Advantages

Using a PoE switch for APs offers several benefits:

- Flexible installation: APs can be mounted on ceilings or high walls without needing nearby power outlets.
- Reduced cabling: Only one Ethernet cable is needed for both power and data.
- Improved stability: Fewer connection points reduce the risk of network interruptions.
- Centralized management: Managed PoE switches allow monitoring and configuration of APs from a single interface .

Troubleshooting Common Issues

If an AP receives power but shows a “notconnect” status:

- Check the port configuration and VLAN assignment on the switch.
- Verify the PoE budget of the switch to ensure sufficient power for all connected devices.
- Test the Ethernet cable with a computer to confirm data connectivity.
- Some switches may require disabling certain logging commands (e.g., no logging event link-status) to properly monitor port status .

Additional Setup Notes

For APs that do not include a PoE adapter, a PoE splitter can be used to separate power and data, allowing non-PoE devices to receive power from a PoE switch . For outdoor or high-speed backhaul setups, combining PoE with fiber connections via SFP modules can extend coverage while maintaining reliable power delivery . By following these guidelines, you can ensure that your APs are powered efficiently, connected reliably, and managed centrally, providing stable wireless coverage across your network.
