

Relay protection current line number

Overview

- 1 - Master Element
- 2 - Time-delay Starting or Closing Relay
- 3 - Checking or Interlocking Relay, complete Sequence
- 4 - Master Protective.

Key Takeaways

The ANSI device number for overcurrent protection on a line is typically 50/51, where 50 denotes instantaneous overcurrent and 51 denotes time overcurrent. Overview of ANSI Device Numbers

ANSI/IEEE device numbers are standardized codes used to identify the function of protective relays in electrical power systems . Each number corresponds to a specific protection function, and suffixes or additional numbers can indicate variations, such as neutral connection, ground protection, or multiple devices on the same line .

Current-Based Line Protection

For line current protection, the most commonly used ANSI device numbers are:

- 50 - Instantaneous Overcurrent Relay: Trips immediately when current exceeds a preset threshold, providing fast protection against short circuits .
- 51 - Time Overcurrent Relay: Trips after a time delay that is inversely proportional to the magnitude of the overcurrent, allowing coordination with upstream or downstream devices .
- 51N / 50N - Neutral Overcurrent Relay: Protects against overcurrent in the neutral conductor, often used in grounded systems .

- 51G / 50G – Ground Overcurrent Relay: Provides protection against ground faults by detecting residual or zero-sequence currents . Suffix numbers (e.g., 51-1, 51-2) are used when multiple overcurrent relays are installed on the same line to distinguish between them .

Additional Considerations

Modern microprocessor-based relays can combine multiple functions in a single device, but the ANSI numbers are still used in single-line diagrams to indicate which protective functions are active . Directional overcurrent relays, which consider the direction of fault current, are often used in distribution networks and are also identified using the 50/51 series with directional logic .

Summary

For relay protection of line currents, the standard ANSI device numbers are:

- 50 – Instantaneous overcurrent
- 51 – Time overcurrent
- 50N / 51N – Neutral overcurrent
- 50G / 51G – Ground overcurrent These numbers are widely used in documentation, schematics, and relay settings to ensure proper protection and coordination in electrical power systems .
