

The router shows that the fiber optic light is not on

Overview

Modem & Router Lights Explained | BroadbandSearchGreen or white lights on a modem or router generally indicate normal operation. Orange, amber, or red light.

Key Takeaways

The fiber optic indicator light on your router may be off due to power issues, loose or damaged cables, a router malfunction, or a problem with your ISP's service.Common Causes

1. Power Issues: If the router is not receiving power, the fiber optic light will remain off. Check that the power adapter is properly connected and the outlet is functioning. Try a different power outlet or adapter if necessary . 2. Loose or Damaged Fiber Cable: A disconnected, bent, or damaged fiber optic cable can prevent the router from detecting a signal. Ensure the cable is securely connected to the WAN/ONT port and inspect it for visible damage . 3. Router or ONT Malfunction: Sometimes the router or Optical Network Terminal (ONT) itself may be faulty. If all connections are correct and the power is on, a hardware issue could be the cause . 4. ISP Service Issues: If your Internet Service Provider is experiencing an outage or maintenance, the fiber light may remain off. Check your ISP's website or contact support to confirm service status .

Troubleshooting Steps

- Check Power and Connections: Ensure the router is powered on and all cables, including the fiber optic cable, are firmly connected .

- **Inspect the Fiber Cable:** Look for cuts, bends, or dirty connectors. Clean the connectors gently if needed and reconnect them .
- **Reboot the Router:** Turn off the router, unplug it for 30 seconds, then plug it back in and power it on. This can often restore the fiber light .
- **Test with Another Outlet or Adapter:** If the light still does not come on, try a different power source or adapter to rule out power issues .
- **Contact Your ISP:** If the light remains off after checking power, cables, and rebooting, the issue may be with the ISP or the router hardware, and professional support may be required . By following these steps, you can identify whether the problem is local (cables, power, or router) or external (ISP service), and take appropriate action to restore your fiber optic connection.
